MY DAILY DATA INVENTORY REPORT

Prepared by: RASHMITHA

USN:01SU24CS112

Date:23-02-2026

1.INTRODUCTION

In today's digital environment, individuals interact with a wide range of data through mobile applications, websites, sensors, and direct user inputs. This report aims to document and analyze the types of data generated or accessed throughout the day, categorizing them as **structured**, **semi-structured**, or **unstructured**.

Structured data is highly organized and easily stored in databases, such as transaction records or sensor readings. Semi-structured data contains some organizational elements like metadata or tags, for example, emails or app logs. Unstructured data lacks a predefined format and includes content such as images, videos, and free-form text.

By maintaining a daily inventory of these data sources, this report provides insight into data usage patterns, highlights the diversity of information generated in everyday activities, and supports better management, analysis, and privacy awareness.

2.OBJECTIVE:

The primary objective of this report is to track and document the types and sources of data interacted with on a daily basis, including mobile applications, websites, sensors, and direct user inputs. Specifically, the report aims to:

1. **Identify data sources** – Understand where daily data originates and the context of its collection.
2. **Classify data types** – Categorize data as **structured**, **semi-structured**, or **unstructured**.
3. **Analyze data patterns** – Observe trends in data interaction, frequency, and format.
4. **Support data management** – Provide insights to improve organization, storage, and accessibility of information.
5. **Highlight privacy and security considerations** – Recognize sensitive or personal data and potential risks associated with daily digital interactions

3.DATA SOURCES

The data we interact with daily comes from multiple sources. Each source produces different types of data, which can be structured, semi-structured, or unstructured. Understanding these sources is essential for proper classification, analysis, and management.

MOBILE APPLICATIONS

Mobile apps are one of the primary sources of personal and system-generated data. They interact with users continuously, often in the background. Examples include:

- **Financial Apps:** Track transaction history, account balances, bill payments, and spending categories.
    - *Structured Data:* Transaction logs, account numbers, timestamps, and amounts.
    - *Semi-Structured Data:* App metadata, such as notifications or JSON logs of transactions.
- **Fitness and Health Apps:** Monitor activity levels, heart rate, calories burned, and sleep patterns.
    - *Structured Data:* Step counts, heart rate readings, and calories.
    - *Unstructured Data:* Free-text notes, photos uploaded to health apps.
- **Social Media Apps:** Collect posts, likes, comments, and multimedia content.
    - *Semi-Structured Data:* User profiles, metadata of posts, timestamps.
    - *Unstructured Data:* Images, videos, text captions, and stories.

Mobile apps produce a mix of sensitive personal data and user-generated content, making them critical to track for both analysis and privacy management.

WEBSITES

Websites collect data whenever a user interacts with them, either passively or actively. They can generate both structured and unstructured data:

- **News Sites and Blogs:** Users read articles, comment on posts, and interact with embedded media.
    - *Semi-Structured Data:* Metadata like author, publication date, and tags.
    - *Unstructured Data:* Article text, images, embedded videos, and user comments.

- **E-commerce Sites:** Track browsing history, purchases, and product reviews.
    - *Structured Data:* Purchase history, product IDs, prices.
    - *Semi-Structured Data:* Reviews and ratings with timestamps, JSON logs of user interactions.
- **Web Forms and Online Accounts:** Capture user input, preferences, and account details.

  Semi-Structured Data: Form submissions, account metadata.

Websites provide a mix of structured and unstructured data and often reflect user behavior, preferences, and engagement patterns.

SENSORS

Sensors are devices that detect and record physical or environmental conditions. They are increasingly common in smartphones, wearables, smart homes, and IoT systems:

- **Wearables:** Track heart rate, steps, sleep cycles, and activity levels.
    - *Structured Data:* Numeric readings like steps, calories, and heart rate.
- **Smart Home Devices:** Thermostats, motion detectors, and cameras collect environmental and security data.
    - *Structured Data:* Temperature, motion alerts, energy usage.
    - *Unstructured Data:* Video clips, audio recordings, camera images.
- **GPS / Location Sensors:** Track location coordinates, routes, and movement patterns.
    - *Structured Data:* Latitude, longitude, timestamps, speed.

Sensor data is mostly structured but can include unstructured multimedia. It's critical for monitoring, automation, and analytics.

USER INPUTS

User inputs are direct contributions from humans, either through typing, speaking, or interacting with devices:

- **Text Input:** Notes, search queries, emails, form submissions.
    - *Semi-Structured Data:* Emails and form data with metadata.
    - *Unstructured Data:* Free-form notes and comments.
- **Voice Commands:** Spoken instructions for virtual assistants.

    - *Unstructured Data:* Audio recordings and speech content.
- **Drawings, Gestures, and Annotations:** Input through apps or smart devices.
    - *Unstructured Data:* Images, sketches, and handwritten notes.

User inputs often drive semi-structured and unstructured data creation. They reflect human behavior and intent, making them important for analysis and personalization.

4.DATA CLASSIFICATION:

1. Structured Data

Structured data is organized and predictable.

- **Banking transactions:** Account number, date, transaction amount, merchant name.
- **Fitness tracker metrics:** Steps taken, calories burned, heart rate readings.
- **Sensor readings:** Temperature, humidity, motion detection, GPS coordinates.
- **Inventory records:** Product ID, quantity, price, reorder level.
- **Attendance logs:** Employee ID, time in, time out, total hours worked.

These are numerical or categorical data stored in a defined format, making it easy to analyze automatically.

2. Semi-Structured Data

Semi-structured data has some organization through metadata or tags but isn't fully tabular.

- **Emails:** Sender, recipient, subject, timestamp (structured part) + message body (unstructured).
- **App logs or JSON files:** Events recorded with timestamps, user IDs, or status codes.
- **Form submissions:** Name, email, and other fields (structured) + open-ended answers (unstructured).
- **Survey responses:** Ratings (numbers) + free-text feedback.
- **Chat logs:** Metadata like sender, timestamp, and chatroom ID, combined with message content.

These mix structured fields with flexible content that still retains some organization.

3. Unstructured Data

Unstructured data has no predefined format and is free-form.

- **Multimedia:** Photos, videos, and audio recordings.
- **Text documents:** Essays, notes, reports, blog posts.
- **Social media posts:** Tweets, Instagram stories, Facebook comments.
- **Voice commands or recordings:** Spoken instructions, messages, podcasts.
- **Sketches or drawings:** Handwritten notes, diagrams, and digital art.

These are difficult to analyze directly using standard tools because they don't follow a fixed format, but they often carry rich qualitative information.

5. CONCLUSION

In today's digital environment, we interact with a vast variety of data, ranging from highly organized numerical records to free-form multimedia content. Through this inventory, it is clear that data can be broadly classified into **structured, semi-structured, and unstructured** types, each serving different purposes and requiring different handling approaches.

Structured data, such as transaction logs and sensor readings, allows for easy storage and automated analysis. Semi-structured data, including emails, logs, and form submissions, provides partial organization that can be leveraged for flexible analysis. Unstructured data, like images, videos, audio recordings, and free-text content, carries rich qualitative information but requires specialized tools for meaningful interpretation.

Maintaining awareness of these classifications helps in understanding the nature of data we generate and interact with daily. It also highlights the importance of effective data management, privacy considerations, and the need for appropriate tools and strategies to analyze diverse data types efficiently.

By systematically tracking and classifying daily data, we can improve organization, gain better insights from our interactions, and make informed decisions regarding the storage, use, and protection of information.
